

Campus Relay Growth Plan

Assessment simulation · 5 October 2026 · No campaign executed

Live asset: [campus-relay-growth.vercel.app](#) Proposed workshop: “Build Your First AI Project in 60 Minutes” (free, online). Date, time, instructor and syllabus require organiser confirmation.

Student and offer

Target students declaring 2027 graduation in CSE, IT, ECE, EEE, Mechanical or Civil engineering. They want a first project they can explain or extend, but may doubt the one-hour promise. A seven-part chat accepts their own idea, asks two bounded AI follow-ups, and recommends three labelled proposals. Selecting one reveals an input-to-output flow, hypothetical use case, first-hour path, honest limitation and a linked real-world precedent. The precedent is inspiration, not validation of the student prototype. Eight curated starters with sample files remain available. These are proposed examples, not a confirmed workshop curriculum.

Three priority channels and one optional loop

Priority	Specific route and ask	Format and measurement
1 Technical communities	Request relevant coding clubs, IEEE branches, hackathon groups and GDG on Campus chapters to show a 20-second project preview and share one tagged link.	Editable group post + FAQ; club lead and organiser approve. Count unique exposed visitors, form starts and eligible registrations by partner.
2 Academic / career	Ask faculty, department teams and career offices for one final-year class announcement or targeted email; class representatives coordinate the cohort.	Factual email + slide after logistics approval. Count eligible registrations and visit-to-registration rate by link.
3 Student creators	Ask relevant student or club creators to screen-record one starter for their own final-year engineering audience.	20-second script/caption with subtitles; creator and organiser review. Count tagged visits and eligible conversions.
Optional peer invite	After fictional registration, offer one engineering friend a shared project with distinct roles.	Editable personal message; no auto-send or referral payment. Count valid new eligible friend registrations per registrant offered.

Channel selection follows general university guidance on audience focus, student organisations, targeted email and classroom slides. It does not validate the yields below. Sources: Cornell A&S Communications, [Event Promotion](#); University of Iowa CLAS, [Event Promotion](#).

Seven-day stretch forecast and proposed budget

Technical communities	20 × 15	300
Academic / career	8 × 20	160
Student creators	10 × 10	100
Peer referrals	100 invites × 50%	50
Gross		610
Assumed overlap / ineligible / duplicate	18% rounded	−110
Unique eligible target	Unverified stretch case	500

All yields and the 18% reduction are assumptions; 500 is a target, not an achieved result. At 60% of planned channel yields, the same model is about 300 unique eligible. Proposed ceiling: ₹2,000 = ₹800 fixed creator/demo production + ₹400 visuals/subtitles + ₹0–₹200 hosting + ₹600–₹800 reserve. Actual verified campaign spend: ₹0.

Operating plan and measurement

The demo is an instrumentation proof with fictional identities and synthetic examples. No campaign has been executed.

Seven-day operating cadence

Day	Proposed action	Check
1	Confirm date, instructor, syllabus and permitted claims; prepare approved assets; request partner participation.	No public promise before approval.
2–3	Pilot club, academic and creator routes using distinct tags and message variants.	120 is a planning checkpoint, not observed.
4–5	Fix the weakest funnel step and offer optional friend invite after registration.	300 is a planning checkpoint.
6	Continue supported channels; inspect source overlap and duplicates.	Compare rates with denominators.
7	Deduplicate and check 2027 engineering eligibility; report shortfall or result.	500 remains a stretch target.

Counting contract

One registration per fictional @example.com identity and workspace; eligible means declared 2027 graduation in the controlled engineering branch list. First-touch source gets primary credit, last touch and referral assist remain separate. Registration is not attendance. The live Growth desk labels seed rows synthetic and keeps forecasts separate from demo counts.

Three proposed tests

1 Personalised preview

Hypothesis: a branch/level/student-written idea match raises intent. Test generic workshop summary (A) versus Matchmaker preview (B). Metric: unique eligible registrations / unique visitors exposed to each arm; guardrail: preview-to-form drop-off.

2 Concrete take-home

Hypothesis: a tangible starter raises perceived value. Test broad project copy (A) versus downloadable outline or curated sample bundle and next steps (B). Metric: unique eligible registrations / unique exposed visitors; guardrail: expectation clarity.

3 Cross-branch friend invite

Hypothesis: distinct roles bring more valid peers. Test simple optional invite (A) versus two-branch shared-project preview (B), offered after original registration. Metric: new eligible referred registrations / original registrants offered each arm; separately count opens and rejected self/duplicate attempts.

What changed and what comes next

A generic workshop page and broad promotion became a student-written idea and scoped project preview, three trusted campus channel groups, an optional cross-branch loop and unique eligible source counting. With another 24 hours, the candidate would confirm logistics, run a small consented student/mentor usability review, then repair the weakest observed funnel step. These actions are future work, not a claimed pilot.

Boundary: Demo identity is fictional; unique records do not prove unique humans, deliverability, attendance or organiser approval. Demo variant assignments show denominator logic; they are not real experiment outcomes or evidence of uplift.
