

Campus Relay Growth Plan

Assessment simulation · 5 October 2026 · No campaign executed

Live asset: <https://campus-relay-growth.vercel.app>

Proposed workshop: “Build Your First AI Project in 60 Minutes” (free, online). Date, time, instructor and exact syllabus require organiser confirmation.

Student and offer

The target is students who declare a 2027 graduation year in CSE, IT, ECE, EEE, Mechanical or Civil engineering. They may want a first project they can explain in an interview or extend with a friend. Their likely concern is whether an “AI project in an hour” is realistic. Campus Relay asks five conversational questions: branch, a branch-specific challenge or their **own typed idea**, preferred kind of output, starting level and desired payoff. It connects those replies into three AI-labelled project proposals, each explaining its personal fit, a concrete first-hour demonstration, sample input/output, a 10+15+25+10-minute path, a downloadable outline and one honest limitation. Eight curated starters with sample files remain available through a separate action. The actual workshop project is unconfirmed; the previews demonstrate how relevance could be communicated.

Three priority channel groups and one optional loop

Priority	Route and specific ask	Format and approval	What the demo measures
1. Technical communities	Request participation from relevant coding clubs, IEEE branches, hackathon groups and GDG on Campus chapters across colleges. Ask a lead to show a 20-second project preview and share a unique link.	Editable group post, FAQ, short screen recording. Club lead and organiser approve before any real sharing.	Unique exposed visitors, form starts, eligible registrations by club, partner and creative.
2. Academic and career channels	Ask faculty, department teams and career offices for one final-year class announcement or targeted email; class representatives coordinate the right cohort.	Factual academic email and one-slide explanation, with event logistics confirmed first.	Unique eligible registrations by department link and visit-to-registration rate.
3. Student project-demo creators	Ask small relevant student or club creators to demonstrate one project starter on their own channels. Focus on final-year engineering reach, not broad impressions.	20-second script/caption with subtitles; creator and organiser review.	Creator-specific tagged visits and eligible conversions.
Optional peer invitation	After a fictional registration, a student may invite one engineering friend to see a shared project with distinct roles.	Personal editable message; no automatic sending or payment per referral.	Valid new eligible referred registrations per original registrant offered the invite.

Cornell's event-promotion guidance supports audience selection, cross-promotion with student organisations, targeted email and class slides; Iowa's guide also describes audience-specific campus channels. These support channel *selection*, not the numerical forecast below. Sources: [Cornell A&S Communications](#), [University of Iowa CLAS](#).

Seven-day forecast and spend

Stretch scenario, all assumptions: 20 community partners × 15 = 300 gross registrations; 8 academic announcements × 20 = 160; 10 creators × 10 = 100; 100 peer invitations × 50% valid new eligible registrations = 50. Gross = **610**. Applying an assumed **18%** overlap, other-year and duplicate reduction (rounded to 110) gives **500 unique eligible**. If channel yields reach only 60%, the same model gives approximately **300**. Partner availability and conversion are unverified; 500 is a target, not a result. The Growth desk lets the reviewer change these inputs.

Proposed budget ceiling: **₹2,000** = ₹800 limited fixed-fee creator/demo production + ₹400 visual/subtitle assets + ₹0–₹200 hosting + ₹600–₹800 reserve. Planned allocations sum to no more than ₹2,000. **Actual verified campaign spend: ₹0**; no outreach was run.

Day	Proposed action	Planning check
1	Confirm logistics and syllabus with organiser; prepare approved assets and request partners.	No public promise before approval.
2–3	Pilot the three channel groups with separate tagged links and two message variants.	120 registrations is a planning checkpoint, not an observed count.
4–5	Fix the weakest funnel step; offer optional friend invitation after registration.	300 is a planning checkpoint.
6	Continue only channels with credible eligible conversion; inspect overlap and duplicate sources.	Compare rates and denominators, not raw volume.
7	Deduplicate, check 2027 engineering eligibility and report shortfall or result honestly.	500 is the stretch target; registration is not attendance.

Measurement and three proposed tests

The live asset uses isolated demo workspaces, persistent SQL, fictional @example.com addresses, unique registration constraints, first-touch primary source, separate last touch and referral assist, and operator-only exports. Seed rows are visibly synthetic. Its numbers demonstrate instrumentation; no actual campaign has been executed.

- Personalised project preview:** Hypothesis: a branch/level/own-idea match raises sign-up intent. Test generic workshop summary (A) versus a Matchmaker preview (B) among comparable fresh visitors. Metric: unique eligible registrations / unique exposed visitors in each arm; guardrail: preview-to-form drop-off.
- Concrete take-home value:** Hypothesis: a tangible starter path raises perceived value. Test broad project copy (A) versus the real downloadable starter outline and next steps (B). Metric: unique eligible registrations / unique exposed visitors; guardrail: expectation clarity.
- Cross-branch friend invite:** Hypothesis: distinct roles drive more valid peer registrations. Test simple optional invite (A) versus a two-branch shared-project preview (B), assigned after the original registration. Metric: new eligible referred registrations / original registrants offered the invitation; separately count opens and rejected self/duplicate attempts.

The demo records illustrative variant assignments and shows editable denominators. It does **not** claim these experiments ran with real students or show significant uplift.

What changed and what comes next

The first idea was a generic workshop page and broad promotion. The final asset moves relevance into a short chat and small project preview, uses three trusted campus channel groups, adds an optional cross-branch loop and counts unique eligible registrations by source. If given another 24 hours, the candidate would seek organiser approval, run a consented usability review with students/mentor, refine any confusing project, and then revisit the weakest observed funnel step. No pilot or partner commitment is claimed here.
